Write a parallel program (using Open MP) to convert a colour image to grayscale and YIQ. The RGB values (in decimal) are already extracted and stored in "KittenRGB.txt" file. Read the input values from the file.

```
Lab6.cpp > main()
1  #include<bits/stdc++.h>
2  #include<omp.h>
3  using namespace std;
4  #define N 300
5  int arr[N*N*3],arr_gray[N*N],arr_yiq[3*N*N];
6  int main()
7  {
8  freopen("KittenRGB.txt","r",stdin);
9  for(int i=0;i<3*N*N;i++){
10 cin>>arr[i];
11 }
12
13 double t1,t2;
14
15 // RGB to GRAY scale
16 t1=omp_get_wtime();
17 for(int i=0; i<300*300*3; i+=3){

```

Parallel execution with more number of threads takes lesser time because work (iterations) is divided among different threads.

Output.txt containing grey scale values.

Output.txt containing YIQ values.
